DISASSEMBLY FOR REPAIR

Remove all numbered parts in the illustration in numerical order, starting with (1).

DISASSEMBLY FOR REPAIR

1. Attaching the LCD panel

2. Assembling the FPC

1. Attach the lithium battery (1).
2. Fold the section 2 (2).
3. Fold the LCD panel (3).

3. Folding the flexible PC board

1. When attaching the encoder with the flexible cable connected to it, fold the flexible PC board about it as shown in the illustration.

CIRCUIT DESCRIPTION

FREQUENCY CONFIGURATION

The TH-25 utilizes a PLL synthesizer system and digital VFO. The VFO is capable of tuning in 5kHz and 10kHz steps, or 5kHz and 12.5kHz steps.

The receiver system configuration is based upon double super-heterodyne principles with a first intermediate frequency (IF) of 16.9MHz and a second intermediate frequency of 455kHz.

Incoming signals from the antenna are mixed with the first local oscillator signal to produce the first intermediate frequency of 16.9MHz. The first intermediate frequency is then mixed with the second local oscillator signal of 17.355 MHz to produce the second intermediate frequency of 455kHz.

Transmitter signals are generated by the PLL VCO then amplified and applied directly to the antenna circuit.

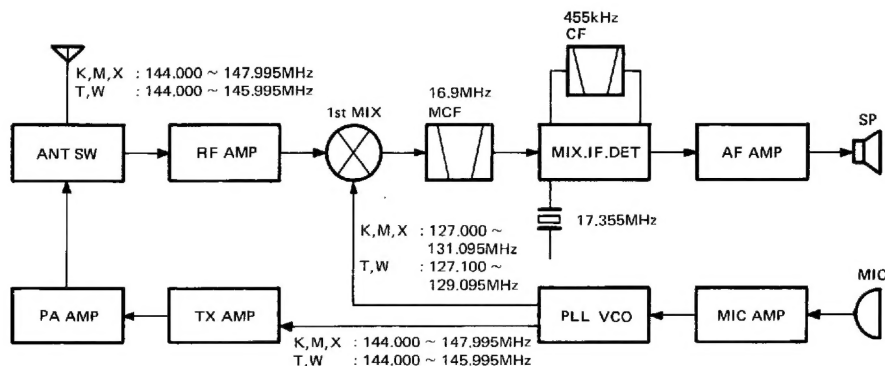

Fig. 1 Frequency configuration

RECEIVER SYSTEM

• General

Incoming signals from the antenna pass through a low-pass filter circuit and enter the front end circuits. The signals are amplified by a cascode amplifier Q1 : 2SC3937 and Q2 : 2SC4215(Y). Undesired signals are removed by a 3-pole tuning circuit utilizing variable capacitance diodes. The resulting signal is mixed with a signal from the PLL VCO by Q3 : 2SK302(Y) in the receiver front-end unit to produce the first intermediate frequency of 16.9MHz. The signal passes through the second monolithic crystal filter (MCF) to provide additional undesirable signal rejection. The signal passing through the MCF then enters IC1 : TK10487MT1 (B,C), in the IF unit, where it is combined with the second local oscillator signal to produce the second intermediate frequency of 455kHz. The 455kHz intermediate frequency signal passes through a ceramic filter (CF1), and then reenters IC1 for additional amplification and demodulation. The output of IC1 is amplified by an AF (Audio Frequency) amplifier IC1 : NJM386BM and applied to the speaker.

Item	Rating

CIRCUIT DESCRIPTION

● Squelch and Mute Circuit

This unit has the T.ALT (Tone Alert) function to produce two muting signals. When a signal is received while the T.ALT function is ON, only a beep will sound.

The microprocessor determines the current condition and provides muting signals MU1 and MU2 as necessary. The conditions required for mute operation are listed in the following table 3. When the microprocessor provides a logic high signal level, muting occurs.

Condition			MU1	MU2
Transmission	Normal operation	When Squelch is ON	H	H
		When Squelch is OFF	L	L
Reception	T.ALT operation	Waiting for Signal	H	H
		Signal is Received (T.ALT operating)	L	H

Muted when the level is a logic "H".

Table 3 Muting conditions

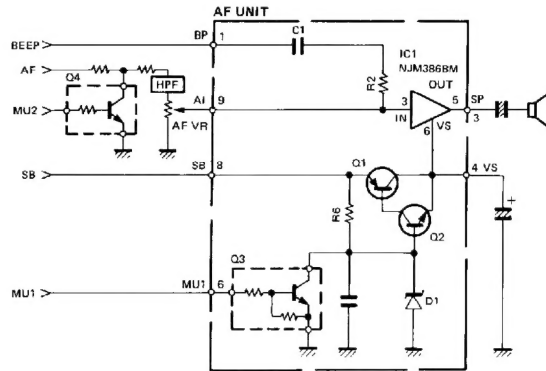

Fig. 2 Mute circuit

● S Meter Circuit

The signal used to drive the S-meter is provided from pin 12 by detecting the output from IF amplifier IC1 : TK 10487MT1(B,C). This signal is routed directly to pin 14 of the microprocessor and is used to control the S meter section of the LCD (Liquid Crystal Display). The indicators operate in pairs, thus providing six signal level indications.

Fig. 3 S-meter circuit

CIRCUIT DESCRIPTION

TRANSMITTER SYSTEM

• General

Transmitter frequencies are obtained by generating the desired signals in the PLL (Phase Locked Loop) circuit.

Frequencies are directly modulated by using the microphone input to vary the voltage applied to the varactor diodes in the VCO (Voltage Controlled Oscillator) circuit.

The output from the VCO circuit is amplified and then applied to the driver and RF power module circuitry where the signal is amplified to the required level for transmission.

• Modulation Circuit

The signal from the microphone enters the MIC amplifier unit where it is amplified and then applied to a limiting amplifier. This signal is then applied to a splatter filter and

the microphone gain control VR1. The signal from the microphone gain control is then applied to the MOD pin where it enters the PLL VCO unit. The signal is then applied to the VCO varicap diode D2 : MA344B in order to obtain the modulated transmit signal.

This method of modulation provides variable reactance phase modulation of the transmitter frequency.

The DTMF (Dual Tone Multi Frequency) signal (option) is fed to the DTMF pin of the MIC amplifier unit. The 1750 Hz tone is supplied from the MPU and applied to pin T1 (Tone Input) of the microphone amplifier unit. This signal is filtered by a 1750Hz LPF (Low Pass Filter).

These signals are processed and routed in the same manner as the microphone signal itself.

Fig. 4 Modulation circuit

• Drive and Final Circuits

The modulated signal from the VCO enters the drive unit, passes through transmit/receive switch D1 and amplified to approximately +20dBm. The APC (Automatic Power Control) control voltage is used to vary the collector voltage of the driver transistor Q2 : 2SC2954, and thus assure a clean signal. The output from the driver is further amplified by the RF power module, IC1 : M57796MA, and then supplied to the ANT connections through the antenna switching circuit composed of D1 and D2.

• APC Circuit

The APC circuit has been provided to supply transmit power stabilization. This circuit is operated by detecting the collector current of the final module by sensing the voltage drop across R4 : 0.22Ω. The comparator IC1 : LM301AD compares this voltage with a 3.9V reference voltage from zener diode D1 : 02CZ3.9YZ and voltage dividers VR1, VR2, and R9. The comparator output is applied to Q1 : 2SA1162(Y) which applies the control voltage to the collector of Q2 in the driver module.

This operation keeps the input power of the final module constant and provides a stable output. Additionally it can be used to limit, somewhat, the current of the final module caused by load variations.

• Hi/Low Switching Circuit

The TH-25 has a transmit power selection switch that allows selection of 5W (with 12V power) in the high power setting and 0.5W in the low power setting. The data from this switch is used to control the output of the drive unit by changing the ratio of the voltage generated by D1, by turning APC unit Q1 : 2SA1162(Y) on and off, and also by changing the input voltage to the comparator.

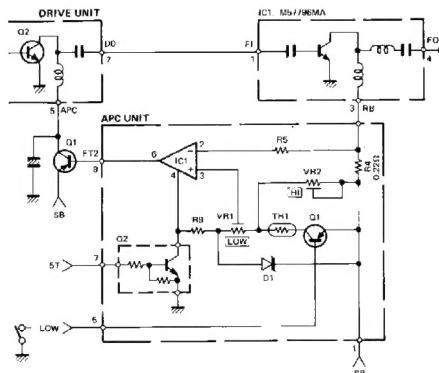

Fig. 5 APC and HI/LOW switching circuit

CIRCUIT DESCRIPTION

POWER SUPPLY CIRCUIT

The TH-25 generates a common supply voltage SB which is used to provide; 5V (5T) for transmission, 5V (5R) for reception, 5V (5C) common transmit/receive voltage, and 5V (5M) for the microprocessor and MIC.

5T and 5R are switched by a signal from the TX terminal. During transmission, microprocessor pin 29 is at a "L" level, so that Q5 : 2SB1218 and Q2 : 2SA1313(Y) go ON and the 5C voltage is output at the 5T terminal. During

reception, microprocessor pin 29 is at a "H" level (open), so that Q1 : 2SD1819 and Q3 : UN5119 go ON and the 5C voltage is output at the 5R terminal.

The normal 5C voltage is generated by a three terminal regulator IC1 : LP2950CZ, differential amplifier IC2 : IMX1 and Q3 : 2SB1182(Q), which is located off of the AVR unit.

The output from the 3 terminal regulator (IC1) is used as the bias voltage for the microprocessor and MIC.

Fig. 6 Power supply circuit

● Battery Saver and Automatic Power OFF

The battery saver and automatic power off functions are provided to conserve on battery consumption when the system is waiting for an incoming signal. The battery saver and automatic power off operations are controlled by control signals from the SAVE pin 3 of the MPU : μ PD 75108AG according to the appropriate conditions at that time.

When this signal is applied all DC power except the 5V : 5M used for the MPU and MIC are turned off. The save function alternates between normal DC voltage and the save condition based upon an 200m second on and 800m second off ratio, i.e. normal voltages for 200m second and 800m second MPU and MIC only voltages.

During the period the automatic power off function is active the 5C voltages are switched OFF to reduce the effective battery drain to approximately 6mA. This circuit will activate if no signal is received for 59 minutes. At this point the microprocessor will cause a 5 second audio tone to sound. One minute after this alert signal sounds the 5C voltages will turn off.

	Save operation	Power OFF operation
Operation starting time	Squelch closes for 10 seconds or more, and no key operation is possible.	Squelch closes for 60 minutes or more, and no key operation is possible. (A beep sounds for 5 seconds after 59 minutes.)
Reset Method	Receive a signal, open squelch, or perform key operation.	Press the MONI key, or turn the power switch ON again.
Display	Normal	

Table 4 Save and power off operation condition

CIRCUIT DESCRIPTION

PLL SYNTHESIZER

The TH-25 utilizes a VCO circuit design in which the transmit and receive sections are independent of each other. The two do make use of common LPF and PLL sections, however.

Comparison frequencies of 5kHz or 6.25kHz are used and correspond to the frequency steps of 5/10kHz or 5/12.5kHz respectively. The 12.8MHz reference oscillator frequency is divided into 1/2560 or 1/2048 to produce the 5kHz and 6.25kHz. The desired transmit and receive VCO frequencies are generated directly by the respective VCO. The transmit/receive signal is sent from pin 10 (SW1) of IC51 : M54959FP. The VCO output signals are sent to the drive unit, and applied to the PLL IC (IC51) simultaneously. This single-chip IC incorporate two modulus prescalers of 1/128 and 1/129, and is arranged in a pulse swallow type of configuration.

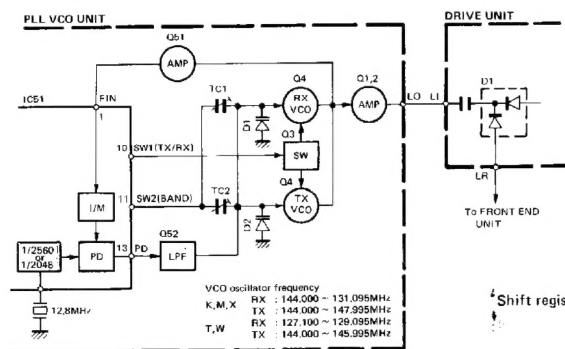

Fig. 7 PLL block diagram

This IC also contains the phase comparator. The output of the comparator is applied through an active low-pass filter, Q52 : XN6501, and is applied to the varicap diode D2 : MA344B of the VCO circuit.

The PLL division ratio and frequency are expressed by the following equation :

$$\text{General division ratio } M = A + 128N$$

Where

A : Swallow counter division ratio

N : Main counter division ratio

The values of A and N are received from the microprocessor as serial data. The values of A and N used for transmit are different from those used for receive. Therefore, the general division ratio M for transmit will be different than that of the value of M calculated for receive. This data is stored in the 21 bit shift register.

Fig. 8 PLL data configuration

MICROPROCESSOR & PERIPHERAL CIRCUITS

• Tone Alert Function (T.ALT)

The T.ALT function sounds a beep and flashes a bell display for 5 seconds to indicate that an incoming signal has been received. When the microprocessor detects that the T.ALT switch has been depressed (S2, I1) it causes a logic "H" to be applied to terminals MU1 and MU2.

The MU1 signal is used to turn the AF amplifier power (VS) off, and the MU2 signal is used to drop the input signal of the AF amplifier to ground by switching transistor Q4 : DTC143TU.

When an incoming signal from the antenna is received, the SC pin of the IF unit switches from a logic "H" to a logic "L". This informs the MPU BUSY pin that a signal has been received at the antenna terminal. When the microprocessor detects this signal it causes MU1 to go "L" which turns the AF amplifiers on.

While this is occurring a beep tone is generated by the microprocessor and is transmitted to the AF amplifier via the BEEP terminal of the microprocessor and then applied to the speaker.

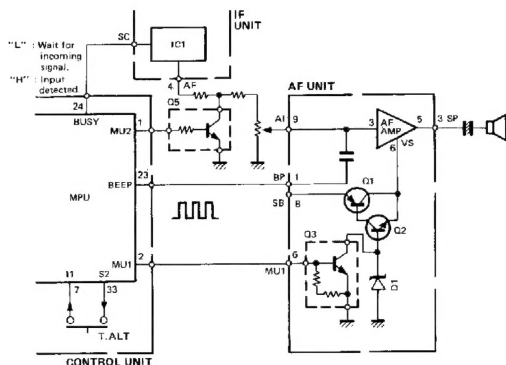

Fig. 9 T.ALT functional circuit

CIRCUIT DESCRIPTION

• Reset and Backup Circuits

Each of these operations is controlled by detecting the state of the 5M line. The microprocessor is reset by applying a pulse, generated by C1 and Q1 : 2SC2712(Y) when the power switch is pressed, to the MPU RESET pin. Backup operations are controlled when the 5M voltage drops to approximately 4.5V (4.3 thru 4.6V). When this occurs the output of IC3 : S8054ALR goes "L". This is felt on the VF pin of the microprocessor and causes the microprocessor to enter the backup mode.

When the 5M voltage increases suddenly, such as when turning on the power switch, the microprocessor will reset. When the voltage rises gradually, the leading edge of the signal supplied from IC3 will change from "L" to "H", which will also reset the microprocessor.

DISASSEMBLY

PACKING

* Refer to parts list on page 15.

ADJUSTMENT

REQUIRED TEST EQUIPMENT

1. Stabilized Power Supply

- 1) The supply voltage can be changed between 5V and 18V, and the current is 3A or more.
- 2) The standard voltage is 12.0V.

2. DC Ammeter

- 1) Class 1 ammeter (17 ranges and other features)
- 2) The full scale can be set to either 300mA or 3A.
- 3) A cable of less internal loss must be used.

3. Frequency Counter (f. counter)

- 1) Frequencies of up to 1GHz or so can be measured.
- 2) The sensitivity can be changed to 250MHz or below, and measurements are highly stable and accurate (0.2 ppm or so).

4. Power Meter

- 1) Measurable frequency : Up to 500MHz
- 2) Impedance : 50Ω, unbalanced
- 3) Measuring range : Full scal of 10W or so
- 4) A standard cable (5D2W 1m) must be used.

5. RF VTVM (RF V.M)

- 1) Measurable frequency : Up to 500MHz or so

6. Linear Detector

- 1) Measurable frequency : Up to 500MHz
- 2) Characteristics are flat, and CN is 60dB or more.

7. Digital Voltmeter

- 1) Voltage range : FS = 18V or so
- 2) Input resistance : 1MΩ or more

8. Oscilloscope

- 1) Measuring range : DC to 30MHz
- 2) Provides highly accurate measurments for 5 to 25 MHz.

9. AF Voltmeter (AF VTVM)

- 1) Measurable frequency : 50Hz to 1MHz
- 2) Maximum sensitivity : 1mV or more

10. Spectrum Analyzer

- 1) Measuring range : DC to 1GHz or more

11. Standard Signal Generator (SSG)

- 1) Maximum frequency : 500MHz or more
- 2) Output : -20dB/0.1μV to 120dB/1V
- 3) Output impedance : 50Ω

12. Tracking Generator

- 1) Center frequency : 50kHz to 500MHz
- 2) Frequency deviation : ±35MHz
- 3) Output voltage : 100mV or more

13. Dummy Load

- 1) 8Ω, 3W or more

PREPARATION

- Set the unit in the receiving mode and set the controls as follows, unless otherwise specified.

POWER/VOL ON
 SQL VR MIN
 F.LOCK OFF
 HI/LOW HI

- Use a non-conductive rod such as a Bakelite rod for adjustment (especially of trimmers and coils).
- To protect the SSG, do not send out signals while adjusting the receiving unit.
- The indicated SSG output levels are for maximum output.

ADJUSTMENT

RESET

Item	Condition	Measurement			Adjustment			Specifications/Remarks
		Test-equipment	Unit	Terminal	Unit	Parts	Method	
1. Reset	1) POWER SW : OFF 2) Hold down  key POWER SW : ON						Unit reset.	Display 144.000

TX-RX COMMON ADJUSTMENT

Item	Condition	Measurement			Adjustment			Specifications/Remarks
		Test-equipment	Unit	Terminal	Unit	Parts	Method	
1. Voltage check	1) Power supply voltage : 12V (External)	DC V.M	TX-RX (B/3)	CN4-7			Check	12V
	2) 5M		TX-RX (C/3)	CN6-3				5V
	3) 5T PTT : ON			CN6-2				5V

PLL ADJUSTMENT

Item	Condition	Measurement			Adjustment			Specifications/Remarks
		Test-equipment	Unit	Terminal	Unit	Parts	Method	
1. Reference frequency	1) FREQ. : 146.000MHz K,M,M2,M3,M4,X FREQ. : 144.950MHz T,W PTT : ON	f. counter Power meter		ANT	PLL	TC51	146.000MHz K,M,M2,M3,M4,X 144.950MHz T,W	±100Hz
2. VCV	RX 1) FREQ. : 145.990MHz	DC V.M	TX-RX (A/3)	TP1	PLL	L1	2.4V	±0.2V
	TX 2) FREQ. : 145.990MHz PTT : ON	Power meter				L2	2.4V	±0.2V

TX ADJUSTMENT

Item	Condition	Measurement			Adjustment			Specifications/Remarks
		Test-equipment	Unit	Terminal	Unit	Parts	Method	
1. Power adjustment (Repeat 2 ~ 3 times.)	1) FREQ. : 147.995MHz K,M,M2,M3,M4,X FREQ. : 145.975MHz T,W HI/LOW : HI PTT : ON	Power meter Ammeter		ANT	APC	VR1	MAX.	5.5W or more.
	2) HI/LOW : LOW						500mW	±50mW Power consumption : 500mA or less.
	3) HI/LOW : HI					VR2	5.3W	Power consumption : 1.2A or less.
2. DEV	1) FREQ. : 146.000MHz K,M,M2,M3,M4,X FREQ. : 144.950MHz T,W AG : 1kHz, 80mV K,M,M2,M3,M4,X AG : 1kHz, 40mV T,W PTT : ON	Power meter AG Linear detector f. counter		ANT	MIC AMP	VR3	±4.2kHz	±200Hz
	2) AG : 1kHz, 8mV K,M,M2,M3,M4,X AG : 1kHz, 4mV T,W PTT : ON						Check	DEV : ±3kHz ± 700Hz

ADJUSTMENT

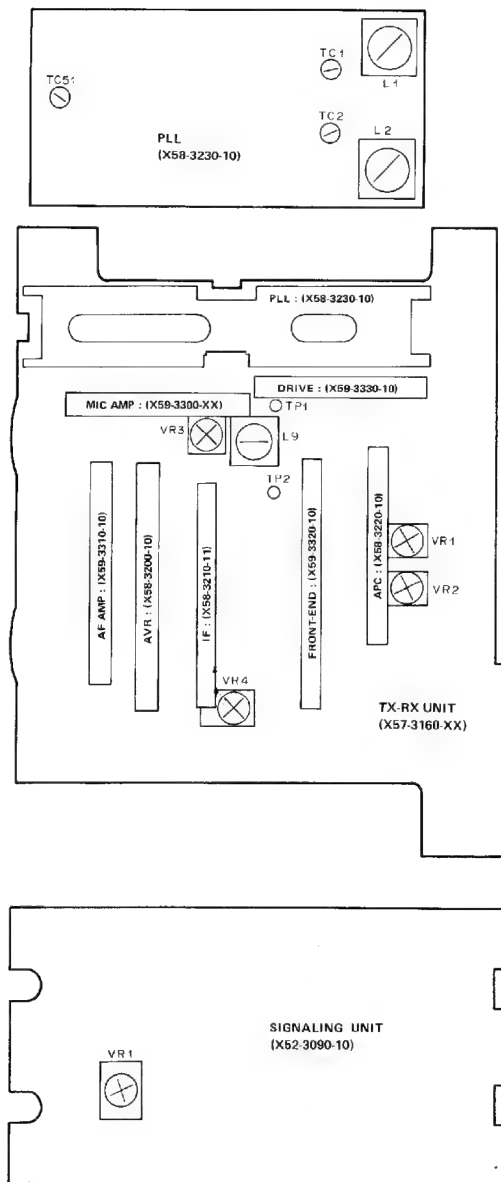

Item	Condition	Measurement			Adjustment			Specifications/Remarks
		Test-equipment	Unit	Terminal	Unit	Parts	Method	
3. TONE TH-25E only	1) FREQ. : 144.950MHz TONE : ON T TONE : Push W	Power meter Linear detector Oscilloscope		ANT			Check	$\pm 2.5 \sim \pm 4.5\text{kHz}$
4. DTMF TH-25AT only	1) FREQ. : 146.000MHz PTT : ON Key board : A , B push	Power meter Linear detector f. counter Oscilloscope		ANT	Signal-ing	VR1	DEV : $\pm 3\text{kHz}$	$\pm 200\text{Hz}$
	2) Keyboard : 2 , 3 push						Check	FREQ. : 1633Hz $+20\text{Hz}, -10\text{Hz}$ DEV : $\pm 0.7\text{kHz} \sim \pm 1.7\text{kHz}$

RX ADJUSTMENT

Item	Condition	Measurement			Adjustment			Specifications/Remarks
		Test-equipment	Unit	Terminal	Unit	Parts	Method	
1. Reception sensitivity	1) Tracking generator output : -40dBm	T.G.		ANT			Check	
		Spectrum analyzer	TX-RX	TP2				
	2) FREQ. : 146.040MHz K, M, M2, M3, M4, X FREQ. : 145.050MHz T, W SSG output : $500\mu\text{V} / -47\text{dBm}$ MOD : 1kHz DEV : 3kHz	Oscilloscope AF V.M Distortion meter SSG		EXT.SP	TX-RX (A/3)	L9	Adjust L9 to the minimum distortion.	5% or less.
	3) AF VR : MAX						Check	1.6V or more
	4) SSG output : $0.18\mu\text{V} / -116\text{dBm}$						Check	12dB SINAD or more
2. S-meter	5) FREQ. : 144.040MHz K, M, M2, M3, M4, X FREQ. : 144.050MHz T, W							
	1) FREQ. : 146.040MHz K, M, M2, M3, M4, X FREQ. : 145.050MHz T, W SSG output : $3.95\mu\text{V} / -89\text{dBm}$	S-meter			IF	VR4	Adjust VR4 that the 6th segment is turned off	" — — " is one pair.
	2) SSG output : $5\mu\text{V} / -87\text{dBm}$							
	3) SSG output : $0.08\mu\text{V} / -123\text{dBm}$						Check	All segment light on. All segment light off.

BC-10 CIRCUIT DIAGRAM

BC-11 (RAPID CHARGER)

BC-11 EXTERNAL VIEW

BC-11 CIRCUIT DESCRIPTION

General

The BC-11 is a rapid charger for the PB-5 to PB-9 Ni-Cd batteries for the TH-25 and TH-45.

Theory of Operation

The operation of each block is explained below.

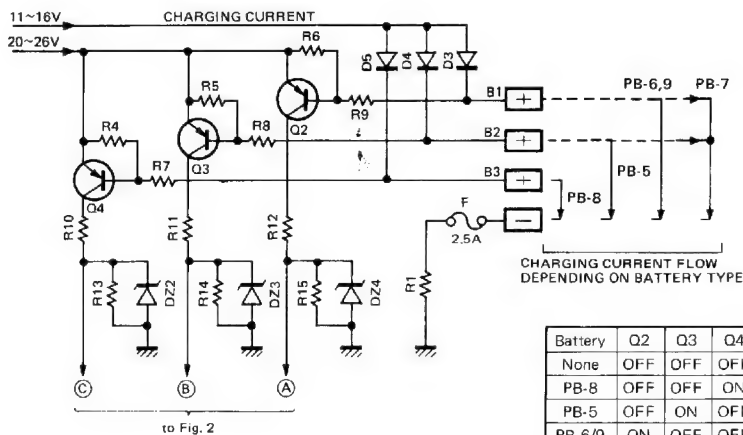

1) +11V AVR Circuit

This AVR circuit, consisting of a 2SD600F transistor (Q1) and DZA11Y Zener diode (DZ1) provides an output of approximately +11V as the reference voltage for the charging circuit consisting of IC2 to IC5.

2) Battery Pack Detect Circuit

This circuit detects whether a battery pack is inserted in the charger. Outputs from this circuit are routed to the reset circuit and the battery recognition circuit.

When a PB-6 or PB-9 is inserted in the charger, a small amount of current flows from Q2 : 2SA608E through R9 to the charging terminal B1 and Q2 turns on. As a result, an output of approximately 11V appears at (A) in Figure 1. Similarly when a PB-5 or PB-7 is inserted Q3 : 2SA608E turns on and approximately 11V is provided at output (B). When a PB-8 is inserted Q4 : 2SA608E turns on and approximately 11V is provided at output (C).

Battery	Q2	Q3	Q4
None	OFF	OFF	OFF
PB-8	OFF	OFF	ON
PB-5	OFF	ON	OFF
PB-6/9	ON	OFF	OFF
PB-7	ON	ON	OFF

Table 1

Fig. 1 Battery Pack Detect Circuit Block Diagram

BC-11 (RAPID CHARGER)

3) Reset Circuit/Charge Status Memory Circuit/ Display Circuit

The reset circuit initializes the charging status memory circuit.

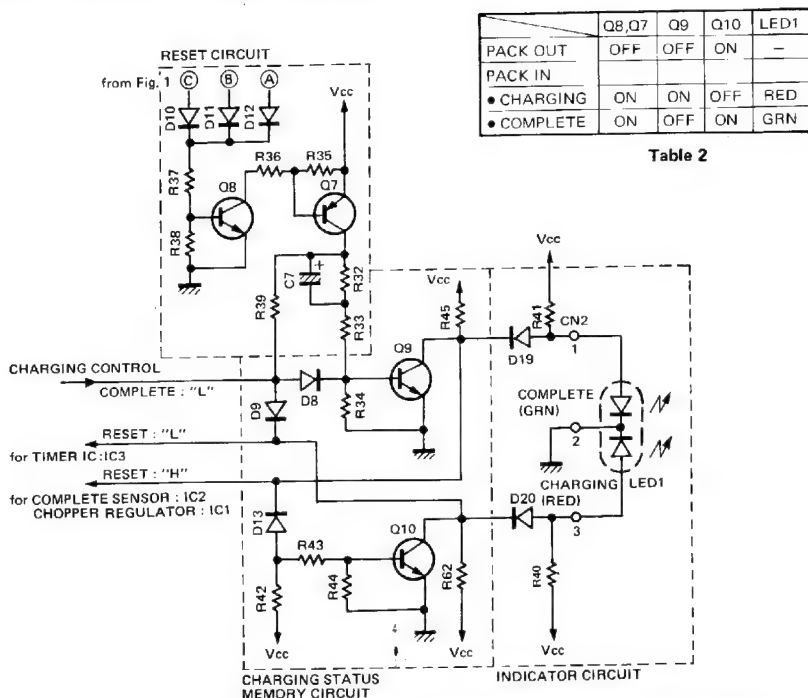

Fig. 2 Reset Circuit/Charge Status Memory Circuit/Display Circuit Block Diagram

The charge status memory circuit is an R-S flip-flop configured from transistors and resistors. The two states of the flip-flop are called COMPLETE and CHARGING. Outputs from the flip-flop drive the LED in the indicator circuit and reset the timer, complete sensor, and chopper regulator. In the COMPLETE state Q9 : 2SC536E is off and Q10 : 2SC536E is on. In the CHARGING state Q9 is on and Q10 is off.

When a battery pack is not inserted, Q8 : 2SC536E and Q7 : 2SC536E turn off. As there is no base voltage to Q9, Q9 also turns off. The base of Q10 receives enough bias from Vcc to turn on, resulting in 0V at the collector. The current flow through R41 to the COMPLETE indicator in LED1 which glows green, because of Q9 if off.

When the battery pack is inserted Q8 and Q7 turn on. As soon as Q7 turns on, charging current flows through R33, R34, and Q9 to C7 and Q9 turns on. The base voltage of Q10, which is connected to Q9 through diode D13, then drops and Q10 turns off. Since Q10 is off, current flows through R40 to the CHARGING indicator in LED1, which glows red to indicate that the battery is charging. When charging of C7 is completed, on-current continues to flow to the base of Q9 through R39 and D8.

When charging is completed the complete sensor (IC2) outputs a Low ("L") signal that ends the flow of current to the base of Q9, turning Q9 off. As a result current flows through R41 to the COMPLETE indicator in LED1, which glows green to indicate that charging is complete.

BC-11 (RAPID CHARGER)

4) Battery Recognition Circuit

The battery recognition circuit uses NAND logic to recognize the battery type from the outputs from the battery pack detect circuit. Outputs from this circuit are sent to the charging current limiting circuit and sensor level switching circuit.

	INPUT		OUTPUT		
	A	B	D	F	G
PB-5	L	H	H	H	L
PB-6	H	L	H	L	H
PB-7	H	H	L	L	H
PB-8	L	L	H	L	L
PB-9	H	L	H	L	H

Table 3

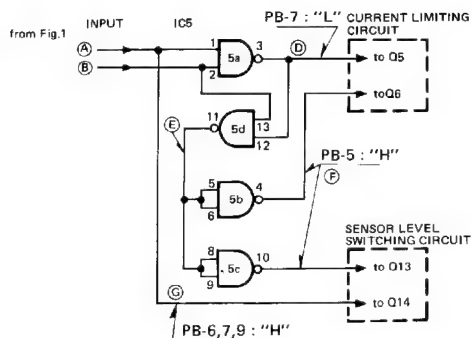

Fig. 3 Battery Recognition Circuit Block Diagram

5) Charging Current Limiting Circuit

This circuit receives the output of the battery recognition circuit and limits the charging current according to the type (current capacity) of battery. The charging current ICR is detected as a voltage drop across R1 (0.15Ω), which is provided to pin 3 of the operational amplifier IC4(1/2) : LA6393A. Pin 4 receives a reference voltage (V_{REF}) used as a comparison standard for limiting the charging current. The V_{REF} is changed by ON and OFF of Q5 and Q6 (See Table 4).

Pin 2 of IC4 : LA6393S provides "L" output when V_{REF} < V_{CR}, stopping the operation of the chopper regulator (IC1 : STK772B) and reducing the charging current. The charging current is limited by the formula :

$$I_{CR \text{ MAX}} (A) = V_{REF} (V) / 0.15(\Omega)$$

	Q5	Q6	VREF	ICR MAX
PB-5	OFF	ON	0.15V	1.0A
PB-6	OFF	OFF	0.25V	1.7A
PB-7	ON	OFF	0.36V	2.4A
PB-8	OFF	OFF	0.25V	1.7A
PB-9	OFF	OFF	0.25V	1.7A

Table 4

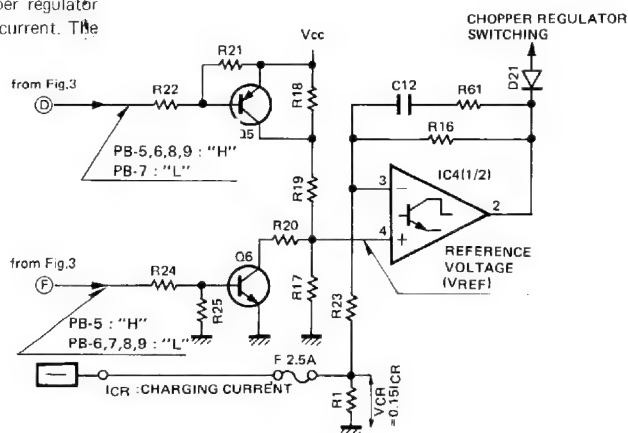

Fig. 4 Charging Current Limiting Circuit Block Diagram

BC-11 (RAPID CHARGER)

6) Sensor Level Switching Circuit

This circuit receives the output of the battery recognition circuit and aligns the voltages supplied to the charging status detect circuit according to the battery type (voltage) so that they are nearly equal at completion of charging.

	SHIFT Es(V)	Q11	Q12
PB-5	2.0	ON	OFF
PB-6	2.0	OFF	ON
PB-7	2.0	OFF	ON
PB-8	7.6	OFF	OFF
PB-9	2.0	OFF	ON

Table 5

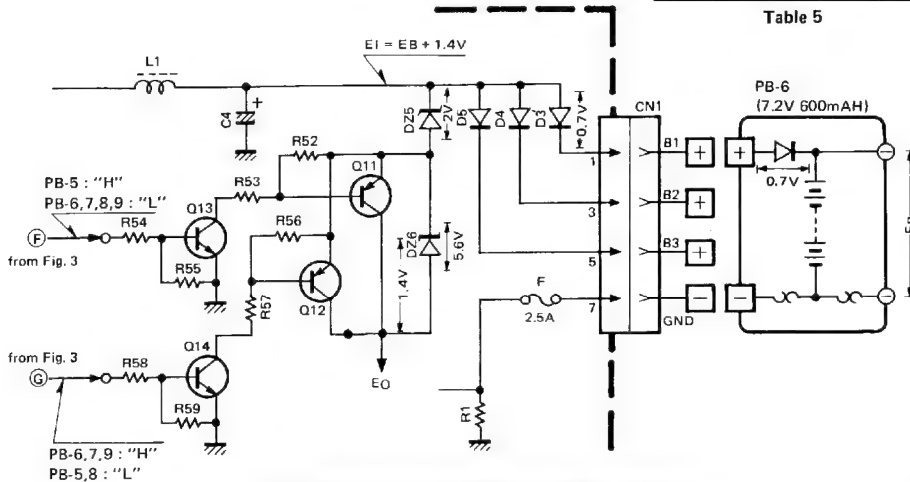

Fig. 5 Sensor Level Switching Circuit Block Diagram

The pin voltages while the Ni-Cd battery is charging are approximately 1.2 times the voltages at the completion of charging. (See Figure 6.)

The battery terminal voltage EB is as follows:

Approximately 14.4V for the PB-8

Approximately 8.6V for the PB-5, 6, 7, 9

The charging line voltage EI is the EB voltage plus a 1.4V voltage drop added by a diode.

$$EI = EB + 1.4V \dots (1)$$

The EI voltage is output with a level shift as the voltage EO to the charging status detect circuit via Zener diode DZ6 and diodes D17 and D18. The amount of the shift is controlled by switching Q11 : 2SA608E and Q12 : 2SA608E on and off. (See Table 5.) If Eq. (1) is substituted into EO in Table 5, the results are:

$$PB-8 : EO = EB - 6.2V$$

$$PB-5, 6, 7, 9 : EO = EB - 0.6V$$

At the completion of charging the value is approximately 8V.

Fig. 6 The pin voltages while the Ni-CD Battery is charging

BC-11 (RAPID CHARGER)

7) Charging Status Detect Circuit

This circuit detects the completion of charging and outputs a signal to stop charging. When no battery pack is inserted or charging is completed, a High ("H") Reset signal is applied to D15. When a battery is inserted the Reset signal applied to D15 is cleared. When the Reset signal is cleared, pin 4 of IC2 : KCH-1003 holds the reset state due to the charge in C8 for the duration of the R46-C8 time constant, then goes "L" to clear the reset state. Pins 8 and 9 of IC2 receive divided portions of the battery voltage. These inputs are tracked as the charging is performed in the long-term memory capacitor "MD". As the Ni-Cd battery charges, the battery voltage reaches a peak, then declines. (See Figure 6.) The MD stores the peak voltage, which is compared with the divided voltages at pins 8 and 9. When the difference ΔV is the same, a "L" signal is output from pin 11 to indicate that charging is complete. The signal indicating completion of charging is applied to the charging status memory circuit.

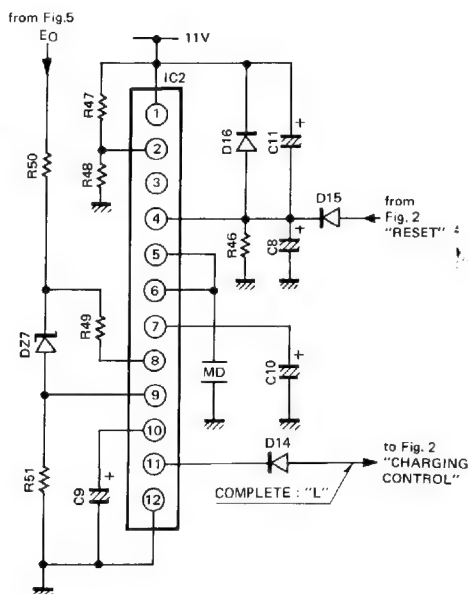

Fig. 7 Charging Status Detect Circuit Block Diagram

8) Timer Circuit

Battery defects may result in charging continuing indefinitely without completion, so this timer outputs a signal that stops charging approximately 1.7 hours after charging begins. When charging begins and the Reset signal is cleared at pin 3, IC3 : AN6780 begins counting. At the first count of 16384 pin 6 goes from "H" to "L". The output from pin 6 is connected to the Stop input (pin 2), so the output of IC3 is held in the "L" state until IC3 receives another Reset signal (for example, when the battery is removed).

Fig. 8 Timer Circuit Block Diagram

Fig. 9 TIMING TIME T1(s) = 11RT(K2) · CT(μF)
TIMING TIME T1(s) = 11 × 47(K12) · 10(μF) = 5170(s)

9) Voltage Comparator Circuit

This circuit monitors the output (EO) of the sensor level switching circuit and indirectly detects abnormal conditions in the battery pack connected to the charging terminal. When the EO voltage falls to 5.2V or lower, the charging control line goes "L" to halt charging.

TSU-6 FINE ADJUSTMENT OF TONE FREQUENCY

The tone frequency can be fine adjusted with an interval of 0.5% step over the range of 0 to +1.5%. Ground the T1 (pin 10) and T2 (pin 9) of IC1 to obtain the desired frequency.

	T1	T2
0%	X	X
+0.5%	O	X
+1.0%	X	O
+1.5%	O	O

O : GND, X : OPEN

SPECIFICATIONS

General

Frequency range	144.00MHz — 148.00MHz (TH-25A/AT) 144.00MHz — 146.00MHz (TH-25E)
Signal type	F3 (F3E)
Power supply voltage	DC 6V — 16V (DC IN jack)
Power consumption	At reception standby ; Approx. 55mA At battery power save ; Approx. 16mA At auto power off ; Approx. 6mA At transmission (5W) ; Less than 1.2A At transmission (0.5W) ; Less than 0.4A
Antenna impedance	50 Ω
EXT. MIC impedance	2k Ω
Operating temperature	-20°C — +50°C
Dimensions	58 (68.5) W x 137.5 (152) H x 29.5 (34.5) D mm The numbers in the parenthesis include projections parts.
Weight	400g (including antenna and Ni-Cd batteries)

Transmitter section

Output power	Hi ; 5W, Low ; 0.5W
Modulation system	Reactance modulation
Max. frequency deviation	± 5 kHz
Unwanted reflection	Less than -60dB
Frequency tolerance	Less than $\pm 20 \times 10^{-6}$ (-10°C ~ +50°C)

Receiver section

Reception system	Double superheterodyne
Intermediate frequency	1st IF ; 16.3MHz 2nd IF ; 455kHz
Sensitivity	12dB SINAD ; 0.16 μ V
Squelch sensitivity	Less than 0.1 μ V
Selectivity	-8dB at more than 12kHz, -40dB at more than 28kHz
AF output	More than 200mW (8 Ω load, distortion 10%)

Design and specifications subject to change without notice.
